

User Documentation

Business Sustainability Management Platform

Group 9 – Five Guys

Document Type: User Documentation Draft Framework

Filename: 9_user_draft.pdf

Purpose of this draft: A detailed writing framework for teammates who will complete the final user manual text and screenshots.

Abstract

This user documentation explains how different users interact with the Business Sustainability Management Platform in practice. The platform supports sustainability operations and ESG management through role-based access, allowing different users to view, enter, review, and manage information according to their organisational responsibility. Core user-facing functions include dashboard review, carbon tracking, waste management, report generation, staff training records, ESG management, and several management-oriented monitoring tools.

This draft is intentionally written as a detailed framework rather than a fully polished final submission. It is designed to help teammates complete the final version even if they are not deeply familiar with every implemented module. For that reason, each section below contains guidance on what the final paragraph should explain, what screenshot should be captured, what workflow steps should be described, and what permission boundaries or business rules should be highlighted.

给队友的写作提示: When finalising this abstract, keep it short and formal. The final version should read like a finished manual, so most explicit drafting prompts in blue can later be deleted or converted into normal text.

1. Document Purpose and Usage Scope

1.1 Purpose of the User Manual

This document is intended to help end users understand how to access the platform, navigate between modules, and perform the main tasks available to them. It is not a system design document. Instead, it focuses on practical interaction from the user perspective, including common workflows such as logging in, entering sustainability records, generating reports, reviewing alerts, and using management pages.

给队友的写作提示: The final paragraph here should explain that the user manual is task-oriented, role-sensitive, and based on the current implemented version of the system rather than early planning ideas.

1.2 Intended Readers

The platform supports four main user roles:

- **Store Staff** – operational users who mainly create and manage carbon and waste records for their own store.
- **Region Manager** – supervisory users who review data across stores within their assigned region and use broader monitoring functions.
- **HQ Manager** – company-level management users who can configure thresholds, manage ESG governance content, review compliance, and maintain organisation-wide user and policy data.
- **Admin** – highest-level platform user with broad access to company-wide or platform-wide administrative functions.

给队友的写作提示: In the final version, keep this section concise. The detailed role behaviour is described later in dedicated role sections.

1.3 How This Manual Is Organised

This manual first introduces login and general navigation, then explains common workflows shared by most users, and finally separates guidance by role. This structure is useful because some pages, such as the dashboard or report page, are visible to many users, while others, such as user management and audit log, are restricted to only a small group.

给队友的写作提示: If the final document becomes too long, this section can be shortened to 2–3 sentences.

2. Getting Started

2.1 Accessing the Platform

Users first arrive at the welcome page and then proceed to the login page. After successful authentication, the system redirects them to the dashboard. The welcome page mainly functions as a landing page, while the login page is the actual entry point for authenticated use.

建议截图说明： Capture one screenshot of the welcome page showing the branding area, hero text, and login button. If space is limited, this screenshot can be omitted and the login page can be prioritised.

给队友的写作提示： Final writing should mention that the platform is browser-based and does not require local software installation for ordinary users. If teammates want to include deployment access instructions, they should only include the real URL or local demo URL if available.

2.2 Login Workflow

The login page contains username and password fields, a login button, and an alert area for failed login attempts. In demo or testing contexts, the page may also show sample test accounts. After login, users are redirected to the dashboard. If the credentials are incorrect, the page displays an error message instead of navigating away.

建议截图说明： Capture the login page with the username/password fields clearly visible. A second screenshot showing an error message is optional but useful if space allows.

给队友的写作提示： Final text should explain the step-by-step process: enter username, enter password, click login, wait for redirect. Also mention that unauthorised users are blocked from protected pages until they log in.

2.3 General Navigation and Layout

Once logged in, users see a shared layout with a left sidebar, top bar, and central content area. The sidebar contains the main modules such as Dashboard, Carbon Tracking, Waste Management, Reports, Training, and ESG Management. Additional management entries such as Alerts, Compliance Score, Anomaly Detection, User Management, and Audit Log only appear for users whose role allows access to those pages.

建议截图说明： Capture one screenshot of any logged-in page that clearly shows the sidebar, top bar, page title, and user role badge. The dashboard page is the best candidate because it is visually rich and includes the standard layout.

给队友的写作提示： The final paragraph should emphasise that visible navigation items are role-sensitive. This is important because users may compare screenshots from different accounts and otherwise think modules are missing.

2.4 Common Interaction Patterns

Several pages use repeated interaction patterns, including data tables, filters, modals, summary cards, form validation alerts, confirmation prompts for deletion, and charts for trend review. This consistency helps users learn the platform faster because once they understand the basic pattern on one page, they can transfer that knowledge to other modules.

给队友的写作提示： The final version should mention common visual elements such as table views, Add buttons, modal-based forms, and success/error alerts. This section can also mention that some charts are interactive and support drilldown.

3. Role and Feature Overview

给队友的写作提示： This table is useful as a quick summary. The final document can keep it, simplify it, or move it to the appendix if space becomes tight.

Role	Main Operational Pages	Management Pages	Typical Scope	Important Restriction
Store Staff	Dashboard, Carbon, Waste, Reports, Training	Minimal	Own store	No high-level management pages; stricter edit/delete limits
Region Manager	Dashboard, Carbon, Waste, Reports, Training, Alerts, Compliance, Anomaly Detection	Monitoring and review	Assigned region	Cannot manage users or create company policies
HQ Manager	Core pages plus Alerts, Compliance, ESG Management, User Management, Audit Log	Company-wide management	Company-wide	Handles governance content and threshold configuration
Admin	Similar to HQ Manager with broader authority	Full administration	Platform-wide	Can manage users more broadly and inspect audit activities

Table 1: Role-oriented summary for the final user manual

4. Shared Core Workflows for Most Users

4.1 Dashboard Review

The dashboard acts as the main overview page after login. It shows summary cards for annual carbon emissions, total waste, recycling rate, and report count. It also includes charts for monthly carbon trend, carbon by category, and waste composition, plus an SDG 12 panel that connects system data with broader sustainability indicators.

给队友的写作提示： Final text should explain what the dashboard is for from a user perspective: quick status review, trend observation, and high-level comparison. Avoid describing implementation details such as API logic or SQL queries because those belong in the system document.

建议截图说明： Capture one dashboard screenshot showing all four summary cards and at least one chart. Prefer a full-page screenshot with the SDG 12 panel visible, because that gives the strongest visual impression.

Suggested points to explain in the final text:

- users land on this page after login;
- the cards provide a quick status summary;
- charts support drilldown and deeper inspection;
- the visible data scope depends on the user's role.

4.2 Carbon Tracking

The carbon tracking page is used to record carbon-related operational activity. Users can create records, review existing entries, and in some cases edit or delete recent entries. The page is especially important for store-level operational input because it feeds later dashboards, reports, and comparisons.

给队友的写作提示： The final wording should describe the page as an operational record-entry workflow. Mention that the user fills in category, activity value, date, and related information, and that the platform calculates or stores carbon-related results in a structured way.

建议截图说明： At minimum, capture one screenshot of the carbon page showing the record table and the add-record area or modal. If possible, add a second screenshot showing comparison or analysis output.

Suggested workflow steps to describe:

1. open the Carbon Tracking page from the sidebar;
2. click the add-record function or open the form;
3. fill in the required fields;
4. submit the record and confirm it appears in the list;
5. if permitted, edit or delete a recent record.

Important behaviour to mention:

- lower-permission users are limited to their own store scope;
- store staff have tighter edit/delete time windows;
- carbon data later contribute to charts, reports, and compliance-related analysis.

4.3 Waste Management

The waste management page is used to record waste generation, recycled quantity, category, source, and disposal information. Like carbon tracking, it is both an operational input page and an analytical data source for later reporting and monitoring.

给队友的写作提示： Final writing should highlight that this page is not only for entering waste quantity, but also for documenting how waste is classified and handled. This makes it suitable for sustainability review and not just raw data storage.

建议截图说明： Capture one screenshot that includes the waste table and the main form fields. If the page includes filters or summaries, include them in the frame if possible.

Suggested points to cover:

- users can add, review, and manage waste records;
- recycled quantity must remain logically consistent with total waste;
- the page supports ongoing waste monitoring and later reporting reuse;
- access scope follows the user's organisational role.

4.4 Sustainability Reports

The Reports page allows users to generate sustainability reports for a selected time range. The user provides a title, report type, and date range, then the system generates a structured report and stores it in the report list. Users can preview the report content, export it as PDF, and optionally request AI-generated ESG analysis.

给队友的写作提示： In the final document, this section should be one of the clearest operational workflows because it is easy for readers to understand and visually strong. Emphasise that the report is generated from existing carbon and waste records rather than written manually from scratch.

建议截图说明： Recommended screenshot set: (1) the report generation form and generated-report table in one frame; (2) the preview panel with report content; (3) optionally the AI analysis area or exported PDF page.

Suggested workflow steps to describe:

1. open the Reports page;
2. enter a title and choose report type;
3. select the reporting period;
4. click Generate Report;
5. open the generated item from the list to preview content;
6. export the report or request AI analysis if desired.

Important details to mention:

- reports are stored in the system after generation;
- the preview area shows generated textual content;
- AI analysis may appear in live or mock mode depending on environment configuration.

4.5 Training Records

The Training page records staff sustainability training sessions and displays training-related statistics. Users can log course name, course type, trainee, duration, completion date, score, and status. The right side of the page presents summary statistics and a filterable training-record table.

给队友的写作提示： Final wording should explain both the data-entry side and the monitoring side. Make it clear that this page supports organisational capability building, not just administrative archiving.

建议截图说明： Capture one screenshot of the Training page with the log form visible on the left and the statistics cards plus training table visible on the right. This page naturally produces a strong screenshot.

Suggested points to cover:

- users can log a new training session through the form;

- course type and completion status help classify records;
- the page provides annual session count, hours, trainee count, and average score;
- filters help narrow the table by course type or status.

4.6 ESG Management Entry Point

The ESG Management area combines supplier ESG assessment and company policy management in one interface. This page is visible broadly, but editing rights are more limited. The page uses tabs to switch between supplier-related content and policy-related content.

给队友的写作提示： The user manual should present this module as a governance-oriented area. Because some teammates may not know the difference between supplier ESG and policy management, keep the explanation simple and role-oriented.

建议截图说明： Capture one screenshot of the ESG Management page with both tabs visible. If possible, use a frame that shows the Supplier ESG table and the tab bar at the same time.

5. Store Staff Guide

5.1 Typical Responsibilities

Store staff are the most operationally focused users. They mainly record day-to-day sustainability data for their own store and support consistent data collection. Their most important pages are Dashboard, Carbon Tracking, Waste Management, Reports, and Training.

给队友的写作提示： The final text should describe this role in practical terms: entering records, reviewing recent entries, supporting report generation, and participating in training-related workflows.

5.2 Recommended Store Staff Workflow

A typical store-staff workflow may look like this:

1. log in and review the dashboard;
2. enter new carbon records for store operations;
3. enter new waste records and confirm recycling values;
4. review or help generate reports for the current period if required;
5. log or review training-related activities.

给队友的写作提示： Teammates can turn this into a short narrative paragraph if the final document needs a smoother tone.

5.3 Store Staff Restrictions and Practical Notes

Store staff do not normally manage thresholds, compliance scoring, anomaly detection, user accounts, or audit logs. They also operate within a narrower data scope and may face stricter time limits for editing or deleting operational records.

给队友的写作提示： This subsection is important because it prevents confusion when screenshots from manager accounts show extra menu items that do not appear for store staff.

6. Region Manager Guide

6.1 Typical Responsibilities

Region managers supervise sustainability performance across multiple stores within their assigned region. Compared with store staff, they focus less on raw data entry and more on monitoring, comparison, and issue identification.

给队友的写作提示： The final text should describe region managers as supervisory users who review patterns and exceptions across several stores.

6.2 Key Pages for Region Managers

In addition to the common pages, region managers can access Alerts, Compliance Score, and Anomaly Detection. These pages help them identify unusual values, assess ESG readiness, and monitor whether stores are meeting sustainability-related expectations.

建议截图说明： For the final document, capture at least one region-manager-oriented screenshot, ideally either the Alerts page or the Compliance Score page.

6.3 Alerts Page

The Alerts page contains alert logs for monitoring threshold breaches. Depending on permissions, region managers can at least review logs, inspect metric values, and monitor whether issues have been noticed or marked as read.

给队友的写作提示： Do not overstate permissions here. Region managers are more focused on reviewing and responding than on company-wide threshold design. The final wording should be careful about that distinction.

建议截图说明： Capture the Alerts page with the alert-log table visible. If the threshold configuration panel is also visible in the chosen account, clearly state in the caption that configuration is usually for higher-level management.

6.4 Compliance Score Page

The Compliance Score page allows management users to calculate and review an ESG scorecard for a selected year. It includes an overall score gauge, a grade label, dimension breakdowns, and detailed metric rows. This page helps managers translate many separate sustainability activities into one structured review surface.

建议截图说明： Capture the Compliance Score page after calculation so that the gauge, dimension bars, and detail table are all populated.

给队友的写作提示： The final paragraph should explain why a manager would use this page: not for data entry, but for performance review and follow-up planning.

6.5 Anomaly Detection

The anomaly detection page helps users identify suspicious or abnormal carbon and waste values. This may include unusual spikes, invalid values, or records that deserve closer investigation.

给队友的写作提示： Teammates should describe this page as a quality-control or exception-review tool. Avoid overly technical explanations such as statistical implementation details unless they are mentioned very briefly.

建议截图说明： Capture the anomaly page after loading results so that highlighted abnormal records are clearly visible.

7. HQ Manager Guide

7.1 Typical Responsibilities

HQ managers operate at company level. They review cross-store performance, manage ESG governance content, configure thresholds, assess compliance, and maintain organisational user records. Their role is one of the most important to emphasise in the user manual because many advanced management pages are designed for them.

给队友的写作提示： The final wording should make clear that HQ managers bridge operational oversight and governance management.

7.2 Alert Threshold Configuration

HQ managers can use the Alerts page not only to review alert logs but also to define threshold rules. The threshold form includes metric type, condition, threshold value, scope, and optional notification email. This allows management to convert sustainability expectations into automated monitoring conditions.

建议截图说明： Capture the Alerts page with the threshold table and, if possible, the Add Threshold modal open. This is one of the strongest management screenshots in the project.

Suggested points to cover:

- HQ managers can define threshold rules for monitoring;

- scope can be company-wide, regional, or store-specific;
- logs show breaches and read/unread state;
- notification email is optional.

7.3 Supplier ESG Assessment

Within ESG Management, HQ managers can create and edit supplier records and complete the ESG scorecard. The system uses 0/50/100 options across several sub-indicators and automatically computes dimension-level scores and the overall grade.

给队友的写作提示： The final user manual should explain this in simple terms: managers choose scorecard values for several criteria and the platform calculates the result automatically. Avoid repeating the full technical weighting logic from the system document.

建议截图说明： Recommended screenshot set: (1) supplier ESG table with grades visible; (2) add/edit supplier modal showing scorecard fields; (3) optional close-up of one supplier row if grade columns are hard to read in the full-page screenshot.

7.4 Company Policy Management

The policy tab supports creation, editing, review, and deletion of ESG-related internal policies. Managers can set title, category, status, effective date, version, and content. Policies can be viewed in read mode and edited in form mode.

给队友的写作提示： This section should help teammates who are less familiar with the module understand that it behaves like a lightweight internal document management page rather than a reporting page.

建议截图说明： Capture one screenshot of the policy list and policy detail pane. If possible, add a second screenshot of the edit form showing the title, category, status, and content fields.

7.5 User Management

The User Management page is available to HQ managers and admins. It contains summary cards, a user table, an add-user modal, edit functionality, password reset, and deletion. The page also supports role assignment and scope assignment through region and store fields.

给队友的写作提示： The final text should explain this page carefully because it is one of the clearest examples of role management in the whole project. Mention that the page supports account lifecycle operations rather than operational sustainability data entry.

建议截图说明： Recommended screenshot set: (1) main user table with summary cards; (2) add-user modal; (3) reset-password modal if there is room.

Important points to mention:

- role selection determines visible permissions elsewhere in the platform;
- some users require region or store assignment;
- password reset is a separate operation;
- users cannot delete their own account through the delete operation.

7.6 Audit Log

The Audit Log page provides management visibility into important system operations. It includes summary cards, filters, and an operation table showing time, user, role, action, target, detail, and IP address.

给队友的写作提示： This section should emphasise review and accountability. The user manual does not need to explain how audit data are stored, only how a manager uses the page to inspect activity.

建议截图说明： Capture one screenshot of the Audit Log page with both the statistics row and filtered operation table visible.

8. Admin Guide

8.1 Admin Position in the Platform

Admins are the highest-level users in the system. In practice, their user-facing workflow overlaps strongly with the HQ manager role, but with broader authority and fewer organisational restrictions. For that reason, the user manual can describe the admin role as an extended management role rather than writing an entirely separate long chapter.

给队友的写作提示： This section can stay short in the final version. It mainly prevents the manual from ignoring the admin role while avoiding unnecessary repetition.

8.2 Admin-Specific Emphasis

The admin user should be described as someone who can:

- manage users at the broadest level;
- review audit and monitoring pages;
- access company-wide management functions;
- support platform-level oversight.

给队友的写作提示： If the final document is near the page limit, this section can be merged into the HQ manager chapter with one final paragraph explaining that admins have broader access.

9. Suggested Screenshot Plan for the Final User Document

Section	Recommended Page	Priority	What the screenshot should clearly show
Getting Started	Login page	High	Username/password fields, login button, overall style
Shared Workflows	Dashboard	High	Sidebar, summary cards, charts, and standard layout
Shared Workflows	Carbon Tracking	High	Record list plus add-record area or form
Shared Workflows	Waste Management	High	Waste record list and key form fields
Shared Workflows	Reports	High	Generate-report form and generated-report table
Shared Workflows	Training	Medium	Log-training form, stats cards, records table
HQ Manager	Alerts	High	Alert logs and threshold configuration area
HQ Manager	ESG Management – Supplier	High	Supplier ESG table and add/edit scorecard modal
HQ Manager	ESG Management – Policy	Medium	Policy list and policy detail or edit pane
HQ/Admin	User Management	High	User table, summary cards, add-user modal
HQ/Admin	Audit Log	Medium	Stats cards, filters, operation table
Region Manager	Compliance Score	Medium	Gauge, grade, dimension bars, detail metrics
Region Manager	Anomaly Detection	Optional	Flagged or abnormal records displayed on the page

Table 2: Screenshot checklist for teammates completing the final user manual

给队友的写作提示： If the final page count becomes tight, keep only the high-priority screenshots and move the rest to backup material.

10. Writing Guidance for the Final Submission

10.1 Tone and Style

The final user manual should use clear, practical English. It should sound like a guide for users rather than a technical research paper. Paragraphs should focus on what the user sees, what the user can do, and what result the user should expect.

10.2 What to Avoid

The final version should avoid:

- backend implementation detail;
- SQL or database-level explanation;
- overclaiming permissions that a role does not really have;

- repeating the same workflow description across roles without adjustment.

10.3 What to Emphasise

The final version should repeatedly emphasise:

- role-sensitive access;
- practical workflows and clear task steps;
- the connection between operational input and management output;
- the difference between everyday pages and advanced management pages.

11. Short Final Conclusion Placeholder

The final conclusion should briefly summarise that the platform supports different user groups through role-based workflows and provides a practical browser-based environment for sustainability operations and ESG management. It should also state that the user manual has focused on implemented functions rather than theoretical future features.

给队友的写作提示： Keep the final conclusion to one short paragraph. This section mainly helps the manual end cleanly.
